

Chapter 7. Quantum Search and Quantum Counting ①

Problem:

Input: $n \in \mathbb{N}$ and a black-box that implements a function

$$f: \{0, 1\}^n \rightarrow \{0, 1\}.$$

$$|\{0, 1\}^n| = 2^n = N.$$

$$\text{if } |\{x: f(x)=1\}| = M.$$

Output: A string $\vec{x} \in \{0, 1\}^n$ with $f(\vec{x}) = 1$. then.

Probability: $\frac{M}{N}$.
 classic $O(N)$ $\leftarrow$ search $N-M+1$ times (worst case) to get the object.

★ Grover's search algorithm $\rightarrow$ quadratic speedup. $O(\sqrt{N})$

Applications: unstructured search / brute force.

Cryptography (key search / hash preimages)

- ① Grover search algorithm with a known number of solutions.
- ② ~~Las Vegas~~ Las Vegas algorithm with a unknown number of solutions.
- ③ Quantum Counting.

"Measure the quantum state"

$$P(f(\vec{x})=1) = \sin^2 \theta = \frac{M}{N}.$$

$$|s\rangle = \frac{1}{\sqrt{N}} \sum_{\vec{x} \in \{0, 1\}^n} |\vec{x}\rangle = \sqrt{\frac{N-M}{N}} |s_0\rangle + \sqrt{\frac{M}{N}} |s_1\rangle = \cos \theta |s_0\rangle + \sin \theta |s_1\rangle.$$

$$\text{with } |s_0\rangle = \frac{1}{\sqrt{N-M}} \sum_{\substack{\vec{x} \in \{0, 1\}^n \\ f(\vec{x})=0}} |\vec{x}\rangle, \quad |s_1\rangle = \frac{1}{\sqrt{M}} \sum_{\substack{\vec{x} \in \{0, 1\}^n \\ f(\vec{x})=1}} |\vec{x}\rangle.$$

$$\sin \theta = \sqrt{\frac{M}{N}} \Leftrightarrow \theta = \arcsin \sqrt{\frac{M}{N}}.$$

"Amplitude amplification": increase the amplitude of state $|s_1\rangle$.

"G"
