

Chapter 4. Robot Dynamics and Control

Motivation

Goal: Write the motion of the joints of robot by Lagrange's equation

$$F_i = m_i \ddot{r}_i \quad r_i: \text{position} \in \mathbb{R}^3, \quad i=1, \dots, n \quad (\text{not linked})$$

$$q_j(r_1, \dots, r_n) = 0 \quad j=1, \dots, k \quad k\text{-constraint}$$

ex) $\|r_1 - r_2\| = l_0$

$$F = \begin{bmatrix} m_1 I & & 0 \\ & \ddots & \\ 0 & & m_n I \end{bmatrix} \begin{bmatrix} \ddot{r}_1 \\ \vdots \\ \ddot{r}_n \end{bmatrix} + \sum_{j=1}^k \lambda_j \Gamma_j \quad (\text{Lagrange multiplier})$$

$$\Gamma_i \in \mathbb{R}^{3n} \quad \text{ex) } \Gamma_i = \nabla q_j$$

$3n + k$ equations with $3n + k$ variables.

• Computationally complex.

Consider $m = 3n - k$ variables $q_1, \dots, q_m$ (satisfying k -constraint)

$$r_i = f_i(q_1, \dots, q_m) \quad \Leftrightarrow \quad q_j(r_1, \dots, r_n) = 0$$

$$i=1, \dots, n \quad j=1, \dots, k$$

Def q_i : generalized coordinate.

$$L(q, \dot{q}) = \underbrace{T(q, \dot{q})}_{\text{kinetic E}} - \underbrace{V(q)}_{\text{Potential E}} \quad \text{Lagrangian}$$

Then Lagrange's equation

$$\frac{d}{dt} \frac{\partial L}{\partial \dot{q}_i} - \frac{\partial L}{\partial q_i} = \Gamma_i \quad i=1, \dots, m$$

(minimizing path of L)
 $q(u) + \epsilon q(u)$

$$\bullet \quad T = \frac{1}{2} \sum m_i \|\dot{r}_i\|^2 \quad \Updownarrow$$

$$\bullet \quad \text{without constraint} \quad F_i = m_i \ddot{r}_i$$

Ex 4.1 Spherical pendulum.

generalized coordinate : $q = (\theta, \phi)$ (original $v: 3$ constraint 1.)

$$r(\theta, \phi) = \begin{bmatrix} l \sin \theta \cos \phi \\ l \sin \theta \sin \phi \\ -l \cos \theta \end{bmatrix}$$

$$\dot{r}(\theta, \phi) = \begin{bmatrix} l \cos \theta \cos \phi \dot{\theta} - l \sin \theta \sin \phi \dot{\phi} \\ l \cos \theta \sin \phi \dot{\theta} + l \sin \theta \cos \phi \dot{\phi} \\ l \sin \theta \dot{\theta} \end{bmatrix}$$

Kinetic energy

$$T = \frac{1}{2} m \|\dot{r}\|^2 = \frac{1}{2} m l^2 (\dot{\theta}^2 + \sin^2 \theta \dot{\phi}^2)$$

Potential energy

$$V = -mgl \cos \theta$$

Lagrangian

$$L(q, \dot{q}) = \frac{1}{2} m l^2 (\dot{\theta}^2 + \sin^2 \theta \dot{\phi}^2) + mgl \cos \theta$$

$$\frac{d}{dt} \frac{\partial L}{\partial \dot{\theta}} = \frac{d}{dt} (m l^2 \dot{\theta}) = m l^2 \ddot{\theta}$$

$$\frac{\partial L}{\partial \theta} = m l^2 \sin \theta \cos \theta \dot{\phi}^2 - mgl \sin \theta$$

$$\frac{d}{dt} \frac{\partial L}{\partial \dot{\phi}} = \frac{d}{dt} (m l^2 \sin^2 \theta \dot{\phi}) = m l^2 2 \sin \theta \cos \theta \dot{\theta} \dot{\phi} + m l^2 \sin^2 \theta \ddot{\phi}$$

$$\frac{\partial L}{\partial \phi} = 0$$

$$\frac{d}{dt} \frac{\partial L}{\partial \dot{q}} - \frac{\partial L}{\partial q} = \begin{bmatrix} m l^2 & 0 \\ 0 & m l^2 \sin^2 \theta \end{bmatrix} \begin{bmatrix} \ddot{\theta} \\ \ddot{\phi} \end{bmatrix} + \begin{bmatrix} -m l \sin \theta \cos \theta \dot{\phi}^2 \\ 2 m l^2 \sin \theta \cos \theta \dot{\theta} \dot{\phi} \end{bmatrix} + \begin{bmatrix} mgl \sin \theta \\ 0 \end{bmatrix} = 0$$

2.2 Inertial properties of rigid bodies.

★ Body frame: Fix center of mass at $(0, 0, 0)$

• $x(t) = p(t) + R(t)r$ $\dot{x} = \dot{p} + \dot{R}r$

Kinetic E. $T = \frac{1}{2} \int_V \rho(r) \|\dot{p} + \dot{R}r\|^2 dV$

$$= \frac{1}{2} \int_V \rho(r) (\|\dot{p}\|^2 + \underbrace{2\dot{p}^T \dot{R}r}_{(i)} + \underbrace{\|\dot{R}r\|^2}_{(ii)}) dV$$

$$(ii) \quad \dot{p}^T \dot{R} \int_V \rho(r) r dV = 0 \quad (COM = 0)$$

$$= \frac{1}{2} \int_V \rho(r) (-\hat{r}w)^T (-\hat{r}w) dV$$

$$= \frac{1}{2} w^T \int_V \rho(r) \hat{r}^T \hat{r} dV w$$

$$= \frac{1}{2} w^T \underbrace{\int_V \rho(r) \hat{r}^T \hat{r} dV}_{\mathbf{I}} w \quad \hat{r}^T \hat{r} = rr^T - \|r\|^2 \mathbf{I}$$

$$I_{xx} = \int_V \rho(r) (y^2 + z^2) dr$$

$$I_{xy} = - \int_V \rho(r) xy dr$$

(Inertia tensor)

$$w = (w_1, w_2, w_3)$$

$$\hat{w} = \begin{pmatrix} 0 & -w_3 & w_2 \\ w_3 & 0 & -w_1 \\ -w_2 & w_1 & 0 \end{pmatrix}$$

$$T = \frac{1}{2} m \|\dot{p}\|^2 + \frac{1}{2} w^T \mathbf{I} w$$
